

Exercise 03 - Handling New Product Events

Required Services

The following services are involved and have to be started before the final exercise validation:

- NotificationSrv (<http://localhost:8010>)
- OrderProcessSrv (<http://localhost:8020>)
- ProductSrv (<http://localhost:8050>)
- WarehouseSrv (<http://localhost:8070>)
- Apache Zookeeper (localhost:2181, starts automatically in the provided Ubuntu VM)
- Apache Kafka (localhost:9092, starts automatically in the provided Ubuntu VM)

Description

The product management team has decided to establish a new follow-up process when a new product has been added to the DB of the **ProductSrv**. To make their job easier and reduce manual efforts, several automatic actions have to be performed when a new product has been successfully created via **POST** <http://localhost:8050/products> (`webshop.products.resources.ProductResource`).

To handle this kind of event-based messaging, the lead developer decided to use the message-oriented middleware Apache Kafka. The **ProductSrv** already publishes a **new product event**. The **NotificationSrv** and the **WarehouseSrv** already subscribe to these events (see the classes `webshop.notifications.messaging.KafkaListener` and `webshop.warehouse.messaging.KafkaListener`), but currently do nothing when such an event comes in.

Tasks

The following actions have to be performed in response to a **new product event**:

1. **NotificationSrv: Add the product to the internal new product DB.** The **NotificationSrv** has an internal DB where new products have to be stored. This action has to be implemented in the `run()` method of the `webshop.notifications.messaging.KafkaListener` class. Use the provided `notificationResource` to invoke its `addNewProduct()` method. The payload for this method is the newly created `webshop.notifications.api.Product` instance that is part of the Kafka message.
2. **NotificationSrv: Notify the sales department about the new product.** The **NotificationSrv** provides functionality for sending a mail to the sales department. This action has to be implemented in the `run()` method of the `webshop.notifications.messaging.KafkaListener` class, in the same fashion as for task 1. Use the provided `notificationResource` to invoke its `sendProductMail()` method. The payload for this method is an instance of `webshop.products.api.NewProductMailRequest`. Below is an exemplary payload:

```
// Creating a new product mail request
NewProductMailRequest newProductMailRequest = new
NewProductMailRequest("NEW_PRODUCT_MAIL", createdProduct);
```

3. **WarehouseSrv: Stock-up on 10 copies of the newly created product.** As a start, the `WarehouseSrv` needs to have 10 copies of the new product available for purchase. This action has to be implemented in the `run()` method of the `webshop.warehouse.messaging.KafkaListener` class, in the same fashion as for task 1 and 2. To initiate the stock-up process, use the provided `warehouseResource` to invoke its `updateProductAvailability()` method. Since this method requires the `productId` as a `LongParam` and the `amount` as an `IntParam`, you need to convert the values before using them as parameters:

```
LongParam productId = new LongParam(String.valueOf(createdProduct.getId()));
IntParam amount = new IntParam("10");
```

Validation

When you are finished with all tasks, make sure all required services (see [Required Services](#)) and the exercise validation UI is up and running (if not, execute `exercise-validation/build-and-run-validation-ui.sh`) and then navigate to `http://localhost:5001` (**it is important to start from this page, because it will determine which version you are working on**). Click on `Exercise 03` and then on `Start Validation`. If every check is successful (`status: true`), pause your stopwatch and notify an experiment admin to write down your time.
